Dear {{First Name}},

Winter in {{city}} could look different this year. The NOAA is expecting a very strong El Niño, which happens when the Pacific Ocean runs warmer than normal and changes the path winter storms take across the United States. For Texas, that usually means a wetter winter with more storms, and when that moisture meets freezing air, it turns into ice.

Before the first winter storm of the season, it's worth making sure your lights, fridge, and Wi-Fi stay on if the power goes out.

I'm Zach Dell, co-founder and CEO of Base Power. We design and build home batteries here in Texas, and our newest, Base Core, has about 3X the capacity of a traditional home battery.

Through the Base and Farmers Electric partnership, Farmers members can get Base Core installed for a one-time $695 fee.

Here's why your neighbors in {{city}} are reserving a Base Core:
- **Whole-home backup:** about 95% less than a traditional generator.
- **Automatic switchover:** if the power goes out, Base Core switches on automatically. No generator to start in bad weather.
- **Extended outage protection:** up to 36 hours of backup*, plus a generator port for longer outages.
- **Built for Texas weather:** -22°F to 122°F, submersion-rated to 3 feet.
- **Included maintenance:** covered for the life of the battery.

Base already powers more than 30,000 homes, holds a 4.8-star Google rating, and has been featured in the Wall Street Journal, Bloomberg, and the New York Times.

Don't wait for the first ice storm this winter.
